

The container identification system

- Container code recognition
- Truck licence plate recognition
- Truck semi-trailer licence plate recognition
- Video and photo record of passage through the gantry
- Traffic efficiency enhancement, faster gantry passage
- Real-time data processing

The container identification system automatically recognizes and processes the container code characters together with other associated data, such as licence plate number of the truck, date and time, video and photo record of passage through the gantry. CIS consists of hardware containing processing unit, high-resolution cameras and passing vehicles detectors and software, that recognizes the container code of the ISO6346 format. Acquired data are stored in a central server database, together with associated details (licence plate number, date, time, name of the driver, video and photo record of passage through the gantry).
